## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims:

- (Currently Amended) A process for setting up the execution of a server-side method by a client-side data processing system <u>for a specific session</u>, comprising:
- creating an a session-specific Application Program Interface on the server side for a server-side software method:
- automatically creating an interpreted script language program that contains calls to the server-side software method in accordance with the <u>session-specific</u> Application Program Interface; and

sending the created interpreted script language program to the client side.

- (Previously Presented) The process of claim 1, further including executing the interpreted script language program on the client side to call the server-side software method.
- (Previously Presented) The process of claim 2, wherein executing the interpreted script language program includes creating a programming language object having the same name as a server-side programming language bean.
- (Previously Presented) The process of claim 2, wherein the interpreted script language program is executed by a non-modified standard browser program.
- (Previously Presented) The process of claim 1, further including initially registering the server-side method on the server side, wherein the registering includes identifying the registered server-side methods.
- (Original) The process of claim 5, wherein no methods are specified, thereby identifying all methods of a bean.
- (Original) The process of claim 5, wherein a subset of methods are specified, thereby identifying the subset of methods.

- (Previously Presented) The process of claim 5, wherein registration is performed using Server Page tags.
- (Currently Amended) The process of claim 1, <u>wherein</u> the <u>session-specific Application</u>

  Program Interface identifying parameters of the method,
- (Currently Amended) The process of claim 1, further comprising allowing specification
  of which server-side methods are included in the <u>session-specific</u> Application Program Interface.
- (Previously Presented) The process of claim 1, wherein the method is a method in a programming language bean.
- (Previously Presented) The process of claim 2, wherein executing the interpreted script language program includes converting the parameters sent to the server side.
- (Previously Presented) The process of claim 2, wherein executing the interpreted script language program includes converting results sent from the server side.
- 14. (Previously Presented) The process of claim 2, where executing the interpreted script language program further includes using Simple Object Access Protocol calls to invoke the server-side method.
- (Previously Presented) The process of claim 2, where executing the interpreted script language program further includes using Simple Object Access Protocol to return results from the server-side method.
- 16. (Previously Presented) The process of claim 1, wherein the interpreted script language program includes instructions for:

declaring public methods for a current session;

setting up Simple Object Access Protocol requests for each server-side method; and instantiating program objects on the client-side that correspond to server-side objects.

17. (Currently Amended) A process for executing a server-side method by a client-side data processing system, performed by the client-side data processing system in a specific session and comprising:

receiving a interpreted script language program that is automatically created by the server-side and that contains calls to the server-side software method in accordance with an a session-specific Application Program Interface; and

executing the interpreted script language program on the client side to call the server-side software method.

- 18. (Previously Presented) The process of claim 17, further including passing parameters to the server-side method when the interpreted script language program is executed on the client side
- 19. (Previously Presented) The process of claim 17, further including receiving results from the server-side method when the interpreted script language program is executed on the client side.
- 20. (Currently Amended) An apparatus for setting up the execution of a server-side method by a client-side data processing system <u>for a specific session</u>, comprising computer instructions being executed by a processor, portions of the instructions comprising:
- a portion for creating an a session-specific Application Program Interface on the server side for a server-side software method:
- a portion for automatically creating a interpreted script language program that contains calls to the server-side software method in accordance with the <u>session-specific</u> Application Program Interface; and
  - a portion for sending the created interpreted script language program to the client side.
